# Print Shop

The Computer literacy program could run on 286, 386 and 486 microprocessors. The Computer Prodigy liked the feel of the 386 but felt more at home using the new i486 also. So why use the newer DMS? The DMS or Data Management system can be considered a higher learning tool. A certain program called The Print Shop was published in 1984 and celebrated computer rooms using banners on the wall with a dot-matrix computer. The cache is where implementations process real time data.

The Print Shop program was a early hit with beginning computer students around Los Arboles. The computer club fell instantly in love with the ease of use in the menu system and the graphics got a lot of thumb ups. The program itself was a new form of literacy meaning digital technology developments made users smarter and popular all around the world. Some spots included Japan and India using Omniglot and Japanese characters to promote more Transliteracy in schools. The computer club was a big melting pot of newbies looking for idenity using imaginations and books and tools for understanding their own work.

The Apple II was a real time based operating system. You store data and can relate a friendship with your family to incorporate cycles of ideas based on love and memory. A users skill is measured based on Numeracy. If a student becomes more savy in natural sciences they develop a computer based renaissance. The Apple was a great information source that produced intelligent thought based on math theories and communication.

# Visicalc

VisiCalc was a DOS program and based on Greek philosopher Zeno of Elea. The program uses another form of DOS known as density of states. The belief is that solid-state physics are based on Physics according to the Eleatic School founded by Parmenides. The subjectivity is that multiprogramming is what VisiCalc is based on. A correct statement in coding can be that bug compatible versions of the software can be defined as jargon or divinity.

Objectivity in the program will be classified as assembler running Multics time sharing system. This interpretes to lexical analysis as virtual memory to store information concurrently. The scheduler is based on the theory of immanence holds that the divine encompasses or is manifested in the material world. This means the computers cache stores computational theory which is described as Qualia. The CPU can be 8 bit and 16 bits plus more like a 2600 one.

In the end VisiCalc displays the inverted spectrum tensors in mathematics. Ricci calculus constitutes the rules of index notation and manipulation for tensors and tensor fields. The spreadsheets based on altered states are still correct machine learning algorithms or ai.

Arthur Lee Samule is credited with the term machine learning in 1959. Arthur knew of Iliffe vectors which are studies in computer science. Ambiguity occurs when abstract data or associative array which is ideology is set of mutually supportive beliefs in a belief system. Ted Nelson a programmer is credited with coining the term hypertext in 1963 used in VisiCalc along with hypermedia in 1965 which was the birth of statements no longer sequential in effect.

# Dosbox

DOSBOX is a 2002 emu that is gnu. Gnu means the software is free. The program can be downloaded off the Internet and uses parameters. The command line interface evolved from a form of dialog once conducted by humans over teleprinter (TTY) machines. When DOS was introduced it was based on the Intel 8086 cpu in 1976. The text on the screen from the OS when the dos booted up is the ISA. The isa is a instruction set architecture.

The command line prompt opens in another Window. You can type commands to run DOSBOX and other PC files. A easier way of using the program is to get a frontend like D.O.G and load the emu from it. Once you do the process of saving your executables and states are even faster because the frontend saves your data. From there a set of headings can run the PC rom files. This means you can literally run hundreds of files emulating older PC software.

I used my personal experience as a early DOS coder to run command lines and ran applications easily. The program started up on a Envy computer using the run as administrator option. The dosbox website displays Peter Veenstra, Sjoerd, Tommy Frossman and ULF Wohlers are behind the app. The app even has a search engine for your own personal data you create within the program. With a few simple downloads the days of symbolic machine codes exist in a modern age.

# Prodigy Apple 2

The Apple Prodigy takes on more software from the days of DOS programming including Print Shop and Visicalc. Dosbox a emu is also in the latest book.
